

Salicylic Acid Paste instructions

Our Salicylic Acid Paste is a much more pleasant way of ridding your face, head or hands of common Solar Keratosis sun spots than the usual, painful freezing treatment with its large unsightly sores, pain, swelling and scarring.

Solar Keratosis sun spots are not large brown freckles, but rough, scaly spots caused by sun damage. They can be the forerunner of more serious squamous cell or basal cell skin cancers.

For those more serious skin disorders, we recommend our more powerful herbal Bloodroot Paste (to be used under the direction of an experienced health practitioner).

It is important though that the paste is stirred before each application as the oil floats to the top of the paste. If the product becomes dry, add a little olive oil and stir in thoroughly.

Directions for use

Just dab a shallow blob of Salicylic Acid Paste on to the Solar Keratosis sun spots once a day for three days in a row. (A tiny paintbrush is ideal for this.) There may be a mild sting for the first minute or two on sensitive skin. The paste can be made thinner if desired with the addition of a little olive oil.

Leave on for at least two hours each day, then wipe off with a damp tissue. One to three days after the last application you will generally find that the sun spots whiten, dry up, and peel off. However larger, deeper sun spots may need a repeat treatment.

Use for warts too

Salicylic Acid Paste is also highly effective for removing warts. These may take a little longer. Just keep applying the paste once daily until they fall out.

Use Aloe Vera Gel to prevent recurrence

Applying our top quality Aloe Vera gel daily for two months afterward to the skin area where your sun spots or warts have been healed, will generally effect a permanent cure without any recurrence of the Solar Keratosis or warts.

Store Salicylic Acid Paste in a dark place, and out of reach of young children.
